

Abstract

An apparatus is disclosed for semi-automatically feeding and inserting spherically and non-spherically shaped members into pre-drilled holes on an architectural sign face corresponding to the pattern of Braille letters designed to be formed in the sign. A device is disclosed for holding a reservoir of spherically or non-spherically shaped members, delivering the members from the cylindrical storage tube to a delivery end whereby the member is forcibly inserted into the pre-drilled hole on the sign face by pressure from the user in an arrangement desired for accurately duplicating Braille letters.
